

Kevin Van Geem is full professor in the Faculty of Engineering and Architecture at Ghent University (UGent). He is the director of the Center of Sustainable Chemistry and the chair of the board of the Laboratory for Chemical Technology at Ghent University. He is the CTO of CAPTURE, an inter-university platform that brings together 100 faculty members from different universities to accelerate radical technological innovations in sustainable resource recovery. His main research interest is reaction engineering in general, with a particular focus on the transition from fossil to alternative resources, including biomass, CO/CO₂, and, most importantly, plastic waste. He is a former Fulbright Research Scholar of MIT and a visiting professor at Stanford and Shanghai Jiao Thong. He is in charge of the pilot plants for chemical recycling, oxidative coupling of methane, steam cracking, biomass pyrolysis, and super dry reforming. He is the author of more than 400 scientific publications, holds 7 patents, and is the managing director of his own spin-off company focused on modelling steam cracking. He is involved in electrification, process intensification, machine learning & data mining, drug design, scale-up, and process modelling.
